

COLUMBIA ASSOCIATION: Package HVAC Unit Conversion to Dual Fuel Heat Pumps

Columbia Association reduced natural gas consumption by approximately 70% and GHG emissions by 18 metric tons per year after installing five dual fuel heat pump (DFHP) units at a fitness facility.

-  **Optimizing units with manufacturers by decreasing natural gas auxiliary changeover from 30 to 25 degrees Fahrenheit**

-  **Installed three DFHP units at another facility and two additional units currently being specified at other locations**

-  **Made DFHP package units the new standard specification for Columbia Association's building portfolio**
