VOLUME 3  
PRECIPITATION**

## PREFACE

Canadian Climate Normals is a series of separate volumes of climate data for temperature, precipitation, wind, sunshine, etc., each on a national basis. The data comprises: normals based on the period 1951 to 1980, which is the current 30-year period for climate normals as recommended by the World Meteorological Organization; extremes from the entire period of record at each station up to and including 1980; and other statistics such as frequencies, percentiles and standard deviations depending on the element.

This volume provides normal values of precipitation in metric units (mm and cm) for all climate stations for which at least five years of records exist in the period 1951 to 1980. For the first time a statistical method is used to adjust data for short-period stations. The stations are arranged alphabetically by provinces and territories.

The values in this book are from the same data in Temperature and Precipitation Normals 1951-1980 published in six regional volumes.

## PRÉFACE

La série "Normales climatiques canadiennes" se compose de volumes de données climatologiques à l'échelle nationale distincts pour la température, les précipitations, le vent, l'insolation, etc. Les données englobent les normales pour la période s'étendant de 1951 à 1980, soit la période de 30 ans actuellement recommandée par l'Organisation météorologique mondiale; les extrêmes pour toute la période de relevé à chaque station jusqu'à 1980 y compris et d'autres statistiques, comme la fréquence, le centile et l'écart type selon l'élément météorologique dont il est question.

L'ouvrage présente les valeurs normales de précipitations (mm ou cm) pour toutes les stations climatologiques pour lesquelles il existe au moins cinq ans de relevés entre 1951 et 1980. Les stations sont rangées alphabétiquement par province et par territoire. C'est la première fois qu'on se sert d'une méthode statistique pour corriger les données des stations ouvertes depuis peu.

Les données du présent livret figurent également dans les six volumes régionaux de Température et précipitations 1951-1980.

# CANADIAN CLIMATE NORMALS

**1951 – 1980  
VOLUME 3  
PRECIPITATION**

## 1. Introduction

The normal of a climate element is defined as the arithmetic mean of the observed values of that element over a specific period of time. The true mean, that is, the mean of all possible observations, can never be known exactly, but must be estimated from some sample of the past record. The normals presented here are estimates of the true mean obtained in the 30-year sample record, 1951 to 1980.

This volume contains tables of monthly and annual normals of precipitation for 2700 stations that have an appreciable length of record. The actual period of record used to compute each normal is indicated by a code number that is displayed following the corresponding annual value in the tables. The stations are arranged in alphabetical order.

## 2. Observing Precipitation

The rain gauge is usually placed on a level, grassy surface where it is free from the sheltering influence of trees and buildings. The official Canadian rain gauge is used to collect and measure the amount of rain, drizzle, freezing rain, freezing drizzle, or hail to the nearest 0.2 millimetre. The rim of the gauge is 40 cm above the surface of the ground and has a circular orifice 11.3 cm in diameter. The rain is funnelled into a clear plastic graduate, which serves as a measuring gauge.

Snowfall is measured with a standard snow ruler by measuring the depths of freshly fallen snow at a number of representative points and recording the average to the nearest 0.2 centimetre.

# NORMALES CLIMATIQUES CANADIENNES

**1951 à 1980  
VOLUME 3  
PRÉCIPITATION**

## 1. Introduction

La normale d'un élément climatique est la moyenne arithmétique des valeurs de cet élément, relevées sur une période donnée. La vraie moyenne, c'est-à-dire la moyenne de toutes les observations possibles, ne peut jamais être déterminée exactement; elle doit être estimée à partir d'échantillons des relevés passés. Les normales qui figurent ici sont des estimations de la vraie moyenne obtenues à partir des relevés faits sur la période de 30 ans, de 1951 à 1980.

Le présent volume contient seulement les normales mensuelles et annuelles des précipitations pour les 2700 stations, dont les relevés s'échelonnent sur une assez longue période. La période réelle de relevés utilisée dans le calcul des normales est indiquée par des codes numériques qui suivent les valeurs annuelles. Les stations sont énumérées en ordre alphabétique.

## 2. Précipitations – procédures d'observation

On place habituellement le pluviomètre sur une surface plane et herbeuse, qui n'est protégée ni par des arbres ni par des immeubles. On utilise un pluviomètre canadien, officiel, pour recueillir et mesurer, à 0,2 millimètre près, la quantité de pluie, de bruine, de pluie verglaçante, de bruine verglaçante ou de grêle. La bague du pluviomètre se trouve à 40 cm au-dessus du sol et elle a une ouverture circulaire d'un diamètre de 11,3 cm. La pluie est amenée par un entonnoir dans une éprouvette graduée en plastique transparent, dans laquelle elle est mesurée.

La quantité de neige tombée est mesurée à l'aide d'une règle à neige normalisée, à plusieurs

Snow drifts and wind-swept bare spots are avoided as much as possible when making an observation.

At most ordinary climate stations, the water equivalent of the snowfall is obtained by simply dividing the snowfall by 10. At principal and some ordinary climate stations, equipped with a shielded Nipher gauge (Figure 2), the contents of the gauge are melted to obtain the water equivalent.

Total precipitation is recorded as rainfall plus the measured water equivalent of the snowfall, while the snowfall is recorded as the depth of newly fallen snow. Since the water equivalent, and hence the depth of freshly fallen snow, varies with temperature and other factors, readings from snow gauges are superior in accuracy to those obtained from the snow ruler.

At most stations, precipitation measurements are made twice daily – in the morning, and in the late afternoon. At some stations only one observation is taken daily, while at principal stations observations are taken four times daily.

### 3. The Data Tables

Ten tables of monthly and annual precipitation data are presented for stations arranged in alphabetical order by province or territory.

The tables are as follows:

Table	
1	Mean rainfall
2	Mean snowfall
3	Total precipitation
4	Standard deviation of total precipitation
5	Number of days with measurable rainfall
6	Number of days with measurable snowfall
7	Number of days with measurable precipitation
8	Greatest rainfall in 24 hours
9	Greatest snowfall in 24 hours
10	Greatest precipitation in 24 hours

These Precipitation values are monthly and annual totals of the daily amounts that have been averaged over the 30-year period of record for each month. The annual amount is the total of the 12 monthly values. Total precipitation is rainfall, plus the water equivalent of the snowfall and all

endroits représentatifs de la hauteur fraîchement accumulée et en enregistrant la moyenne à 0,2 centimètre près. Lors des observations, on évite le plus possible les congères et les endroits nus balayés par le vent.

À la plupart des stations climatologiques ordinaires, on calcule l'équivalent en eau de la chute de neige en divisant tout simplement par 10 cette chute de neige. Les stations climatologiques principales et certaines stations ordinaires sont équipées d'un nivomètre à écran de Nipher (figure 2): on fait fondre le contenu du nivomètre pour obtenir l'équivalent en eau.

Les précipitations totales sont enregistrées comme étant la chute de pluie plus l'équivalent en eau mesuré de la chute de neige, tandis que la chute de neige est enregistrée comme étant la hauteur de la neige fraîchement tombée. Étant donné que l'équivalent en eau de la neige fraîchement tombée varie en fonction de la température et d'autres facteurs, les lectures faites à l'aide des nivomètres sont plus précises que celles effectuées avec la règle à neige.

À la plupart des stations, on mesure les précipitations deux fois par jour – le matin et à la fin de l'après-midi. Certaines stations ne font qu'une seule observation par jour tandis que les stations principales font quatre observations par jour.

### 3. Tableaux de données

On présente dix tableaux de données mensuelles et annuelles sur les précipitations pour des stations rangées alphabétiquement par province et par territoire.

Les tableaux se présentent comme suit:

Tableau	
1	Hauteur moyenne de pluie
2	Hauteur moyenne de neige
3	Précipitations totales
4	Écart type des précipitations totales
5	Nombre de jours de pluie mesurable
6	Nombre de jours de neige mesurable
7	Nombre de jours de précipitations mesurable
8	Hauteur de pluie maximale en 24 heures
9	Hauteur de neige maximale en 24 heures
10	Hauteur de précipitations maximale en 24 heures

Ces valeurs sont les totaux mensuels accumulés des quantités quotidiennes dont on a fait la moyenne, pour chaque mois, au cours de la période d'enregistrement de 30 années. La quantité annuelle est le total des 12 valeurs mensuelles. Les précipitations totales comprennent les chutes de pluie, auxquelles viennent s'ajouter l'équivalent en eau des chutes de neige et toutes autres précipitations solides. Pour la plupart des

other forms of frozen precipitation. For the majority of stations mean total precipitation (mm) equals the total rainfall (mm) plus one-tenth of the total snowfall (cm); however, for stations equipped with a snow gauge the total precipitation equals the total rainfall plus the measured water equivalent of the snowfall.

Standard deviations of monthly and annual total precipitation (mm) are calculated from the same data used to calculate total precipitation. It is a measure of year-to-year variability.

These values are precipitation extremes observed on one day over the entire period of record at each station up to and including 1980. In each case the number of years of record is given on the line below the extreme.

A day with measurable rain is one on which 0.2 mm or more of rain has fallen. A day with measurable snow is one on which at least 0.2 cm of snow or more has fallen. A day with measurable precipitation is one on which 0.2 mm of water equivalent is recorded.

The number of days with measurable amounts of rain, snow and precipitation recorded in each month from 1951 to 1980 have been added and the monthly totals have been averaged to obtain the normals.

#### Units and Symbols

rainfall	mm	<p>* amounts less than 0.5 except zero.</p> <p><b>T</b> a trace amount, i.e. less than 0.1 mm of liquid precipitation or less than 0.1 cm of snowfall frozen precipitation</p> <p><b>M</b> missing</p>
snowfall	cm	
total precipitation	mm	

#### 4. Climate Normals

Climatologists have generally adopted an arbitrary 30-year period as a standard reference period for normals. The use of 30 years produces fairly constant values with little difference occurring between successive normal periods. However, it should be noted that the choice of 30 years and the use of the term "normal" climate can be misleading.

stations, les précipitations totales moyennes (en mm) correspondent aux chutes de pluie totales (en mm), plus un dixième des chutes de neige totales (en cm). Toutefois, pour les stations équipées d'un nivomètre, les précipitations totales correspondent aux chutes de pluie plus l'équivalent en eau mesuré de la chute de neige.

On calcule l'écart type des précipitations totales mensuelles et annuelles (en mm) à partir des données utilisées pour calculer les précipitations totales. On en mesure ainsi la variabilité d'année en année.

Ces valeurs sont les extrêmes de précipitations observés en une journée, pour la période complète d'enregistrement de chaque station (jusqu'à et y compris 1980). Dans chaque cas, le nombre d'années d'enregistrement est indiqué sous l'extrême.

Un jour de pluie mesurable est un jour où il tombe au moins 0,2 mm de pluie. Un jour de neige mesurable est un jour où il tombe au moins 0,2 cm de neige. Un jour de précipitations mesurable est un jour où l'on enregistre 0,2 mm d'équivalent en eau.

#### Unités et symboles

Chute de neige	cm	
Précipitations totales	mm	

#### 4. Normales climatiques

Les climatologues ont adopté en général une période arbitraire de 30 ans comme période de référence standard pour les normales. L'usage de cette période de 30 ans donne des valeurs assez stables, avec des différences minimales entre les périodes consécutives de normales. Toutefois il faut noter que le choix de 30 années et l'emploi du terme climat "normal" peuvent donner lieu à des malentendus.

The number of years needed to obtain a stable normal value depends on the element, season and region. It should also be remembered that the period of record is not unrelated to the purpose. For example, if statistics are intended to represent average conditions over the very recent past, then a short period of record, say 10 to 15 years, lessens the possibility of inconsistencies in the time series arising from changes in: station location, instrument exposure, observing standards, instrumentation or observer. On the other hand, for studies of climate variability it is desirable to use the longest possible period of record, based on both instrumental and historical records.

#### **4.1 Computing Normals – full-period stations**

In the computation of the precipitation normals for the period 1951 to 1980, the normals for stations with a complete 30-year record are simply arithmetic averages of the 30 years of data. Stations with record lengths between 20 and 29 years invariably yield values that differ only slightly from the 30-year mean so that these data were similarly averaged, i.e. no adjustment made.

#### **4.2 Criteria for Adjusting Data – short-period stations**

The averages for most short-period stations were adjusted to make them comparable with those for full-period stations. The adjustment (described below) was made whenever a station had 5 to 19 years of data, in the 1951-1980 period. Additional available data from the period 1931 to 1950 were also used to adjust station normals.

#### **4.3 Selecting Paired Data for Adjustment**

A good *standard* station was selected for each of the 79 climate districts regularly used by the Atmospheric Environment Service to archive data. The districts are delineated by drainage basin and generally have fairly similar climate and physiographic characteristics. A standard station

Le nombre d'années nécessaire pour déterminer une valeur normale stable dépend de ce qui est mesuré, de la saison et de la région. On devrait garder à l'esprit le fait que la période sur laquelle ont porté les enregistrements n'est pas sans avoir ses répercussions; par exemple, si des statistiques sont destinées à représenter des conditions prévalant sur un passé récent, une courte période d'enregistrement, 10 à 15 années diminue les possibilités d'inconsistance résultant de changements tels que: l'endroit de la station, l'exposition des instruments, les normes d'observation, les instruments ou l'observateur lui-même. D'un autre côté, si l'on étudie la variabilité du climat, il est préférable d'utiliser la plus longue période d'enregistrement possible reposant à la fois sur les relevés historiques et ceux réalisés à partir d'instruments.

#### **4.1 Calcul des normales – période entière**

Dans le calcul des normales des précipitations pour la période 1951-1980, les normales des stations qui disposent de relevés complets pour 30 années correspondent à la moyenne des données sur 30 ans. Les stations qui disposent de relevés pour 20 à 29 années ont des valeurs qui diffèrent très peu des moyennes sur 30 années; ces données n'ont donc pas été ajustées.

#### **4.2 Critères d'ajustement des données – période courte**

On a ajusté les moyennes pour la plupart des stations dont les relevés couvrent de courtes périodes, afin de pouvoir comparer ces moyennes à celles des stations disposant de relevés complets. L'ajustement décrit ci-dessous a été utilisé quand une station offrait 5 à 19 ans de données pour la période 1951-1980. Les données supplémentaires disponibles pour la période 1931-1950 ont aussi été utilisées pour l'ajustement des normales.

#### **4.3 Choix des données appariées pour l'ajustement**

On a choisi une station standard de haute qualité pour chacun des 79 districts climatologiques utilisés par le Service de l'environnement atmosphérique pour l'archivage des données. Les districts ont été délimités par bassin versant et possèdent en général des caractéristiques climatiques et physiographiques assez

is one that has an observational record of sufficient length (28 years or more) and quality to serve as a basis for adjusting data for nearby stations. At least one, but generally five or six, standard stations exist in each district.

Provided there were at least five years of data to make a valid comparison, monthly values at the short-period station were paired with corresponding values for each standard station in the climate district. A simple correlation between paired station data was computed and tested for significance. Then the paired stations with the highest significant correlation were selected. Finally an adjustment technique was used to estimate the normals.

#### 4.4 Adjustment Techniques

Data reconstruction and estimation procedures are common in climatology for filling data gaps, for checking doubtful values in a record or for synthesizing normals for stations with short-period records. The method involves using concurrent data from one or more nearby stations in the same climate regime. The adjustment technique used, either the difference or the ratio method, depends on the meteorological element whose statistics are being adjusted.

The "ratio" adjustment is used for meteorological elements that do not have values less than zero such as precipitation, wind, speed, sunshine and "days with". The ratio of the totals or means of two concurrent series is used as a multiply factor. For example, the adjustment ratio for precipitation, is equal to the monthly mean of precipitation calculated for the available years of data at the station being adjusted, divided by the corresponding mean for the standard station. This ratio is the correction multiplied to the normal for the standard station in order to estimate an adjusted normal for the given station.

For adjusted stations, the total of days with rain and days with snow does not necessarily equal the value for days with precipitation because values less than 0.5 were retained and printed as "0" not as an "\*".

homogènes. Une station standard est une station dont les relevés d'observation sont suffisamment complets (au moins 28 ans) et suffisamment bons pour ajuster les normales climatiques des stations avoisinantes. Chaque district compte au moins une station standard; généralement, il y a cinq ou six stations standard par district.

Si les relevés couvrent au moins cinq ans, pour faire une comparaison valable, on apparie plusieurs années de valeurs mensuelles enregistrées à une station sur une courte période, aux valeurs mensuelles correspondantes de chaque station standard à l'intérieur du district climatique. Ensuite, on établit et on vérifie une corrélation simple entre les données appariées. Enfin, on choisit les stations appariées dont le coefficient de corrélation est le plus élevé et on utilise une technique d'ajustement pour déterminer les normales.

#### 4.4 Techniques d'ajustement

On se sert couramment de méthodes de reconstruction et d'estimation de données en climatology pour combler les manques de données, vérifier les valeurs contestables d'un relevé, ou faire la synthèse des normales dans les stations où les relevés couvrent une courte période. On utilise les données concourantes d'une ou plusieurs stations voisines situées dans le même régime climatique. La technique d'ajustement se base soit sur la méthode des différences ou celle des quotients et dépend de l'élément météorologique dont il faut ajuster les statistiques.

La méthode des quotients est utilisée pour des phénomènes météorologiques dont les valeurs ne sont pas inférieures à 0 comme par exemple les précipitations, la vitesse du vent ou l'insolation. La moyenne de deux séries concourantes est utilisée comme multiplicateur, par exemple, l'ajustement, pour les précipitations est égal à la moyenne mensuelle des précipitations pour les années de relevés disponibles, à la station où se fait l'ajustement, divisée par la moyenne des précipitations de ces mêmes années à la station standard. En multipliant ce coefficient de correction par la normale de la station type, on obtient la normale corrigée de la station donnée.

Aux stations où il y a ajustement, le total pour les jours de pluie ou avec de la neige ne représente nécessairement pas la "valeur" de précipitations parce que les valeurs inférieures à 0,5 ont été interprétées comme égales à "0", non comme "\*".

## 5. Code for Length of Record

Each normal of precipitation is based on averages obtained over a number of years in the 1951-1980 period. A code number is assigned to each normal to identify the average number of years used in the calculation and appears in the column labelled "CODE". The average period of record is identified through the use of the following code numbers:

### Code

- 1 complete 30 years
- 2 25 to 29 years
- 3 20 to 24 years
- 4 15 to 19 years
- 5 10 to 14 years
- 6 less than 10 years but more than 4 years
- 7 not assigned
- 8 adjusted normals based on 5 to 19 years, inclusive, from 1951 to 1980 and any other available data from 1931 to 1950.

## 6. Acknowledgements

This series of publications is dedicated to the hundreds of volunteer weather observers across Canada. Publication of any climate normals involves many persons beginning with those who made the original observations. Years of faithful and accurate weather observing are required to generate the data from which normals may be calculated. For example, it takes almost 22,000 separate observations to calculate an annual normal for one station.

Quality control, archiving, computer programming and publishing are just a few of the other tasks that must be performed. D.W. Phillips coordinated the project to produce the 1951-1980 normals and long period abstracts; D. Aston prepared program and data specifications and designed publication layouts; Mrs. J. Blackburn and F. Yates supervised the writing of several programs; Y. Durocher developed the data adjustment technique and W. Johnson designed the cover.

## 5. Code des périodes d'enregistrement

Chaque normale de précipitations repose sur des moyennes obtenues à partir d'un certain nombre d'années durant la période 1951-1980. Un numéro de code est donné à chaque normale pour identifier le nombre moyen d'années utilisé dans le calcul et se retrouve dans la colonne "CODE".

### Code

- 1 30 années au complet
- 2 25 à 30 années
- 3 20 à 24 années
- 4 15 à 19 années
- 5 10 à 14 années
- 6 moins de 10 années mais plus de 4
- 7 libre
- 8 normales ajustées sur la base de 5 à 19 années, de 1951 à 1980 et toutes données disponibles de 1931 à 1950.

## 6. Remerciements

La publication de normales climatiques est toujours l'oeuvre de tout un groupe, dont font partie les personnes qui ont relevé les observations initiales. Il faut des années d'observations météorologiques fidèles et précises pour générer les données à partir desquelles on calcule les normales. Ainsi, le calcul de la normale annuelle d'une seule station demande près de 22,000 observations distinctes.

Il a fallu entre autres exécuter un contrôle de la qualité, de l'archivage, de la programmation informatique et de la publication. D.W. Phillips a coordonné le projet en vue de produire les normales pour la période 1951-1980 et les précis pour les longues périodes; D. Aston a préparé les spécifications des programmes et des données et a conçu la mise en page de la publication; Mme J. Blackburn et F. Yates ont dirigé la rédaction de plusieurs programmes; Y. Durocher a mis au point la technique d'ajustement des données et W. Johnson a conçu la page de couverture.

## TO ORDER CLIMATE PUBLICATIONS

Each year the Atmospheric Environment Service publishes climate data and information in a number of current or historical periodicals. Most of the publications are available on subscription. Many one-time publications containing specialized information on statistical summary sheets, in normals booklets, in bibliographies and in atlases are issued on occasion. Information about the contents and format of these publications and how copies may be obtained is available from the Atmospheric Environment Service upon request.

Generally, the front-line supplier of climate information is the regional climatological specialist or his equivalent. For items of an inter-regional, national or international nature, the enquirer should contact the Canadian Climate Centre. The name and address of the office from which subscriptions or copies of publications may be obtained are shown below.

### REGIONAL OFFICES:

Director, Pacific Region  
Atmospheric Environment Service

Atmospheric Environment Service  
4905 Dufferin Street  
Downsview, Ontario M3H 5T4  
Attn: Climatological Services Division

Remittances by cheque or money order should be made payable to the Receiver General for Canada. For a list of publications send for a copy of Selected Publications in Climatology and Applied Meteorology.

## COMMENT SE PROCURER DES PUBLICATIONS CLIMATOLOGIQUES

Chaque année, le Service de l'environnement atmosphérique publie des données et des renseignements climatologiques dans plusieurs périodiques de données courantes ou passées. On peut s'abonner à la plupart de ces publications. À l'occasion, on fait paraître de nombreuses publications à tirage unique contenant des informations spécialisées sous forme de feuillets de données résumés, de livrets de normales, de bibliographies et d'atlas. On peut se renseigner sur le contenu et la présentation de ces publications, ainsi que sur la façon de s'en procurer des exemplaires en s'adressant au Service de l'environnement atmosphérique.

En général, c'est le spécialiste régional en climatologie ou son homologue qui constitue la source immédiate de renseignements climatologiques. Pour les questions de nature inter-régionale, nationale ou internationale, le demandeur doit communiquer avec le Centre météorologique canadien. Vous trouverez ci-après les nom et adresse des bureaux où l'on peut s'abonner ou se procurer des exemplaires de ces publications.

### BUREAUX RÉGIONAUX

Le directeur de la Région du Pacifique  
Service de l'environnement atmosphérique  
700 à 1200, 73<sup>e</sup> avenue ouest  
Vancouver (C.-B.) V6P 6H9  
A/S Section des services scientifiques

Le directeur de la Région de l'Ouest  
Service de l'environnement atmosphérique  
Centre Argyll  
6325, 103<sup>e</sup> rue  
Edmonton (Alberta) T6H 5H6  
A/S Section des services scientifiques

Le directeur de la Région du Centre  
Service de l'environnement atmosphérique  
Bureau 1000  
266, avenue Graham  
Winnipeg (Manitoba) R3C 3V4
